

From PT File to Billing Counter

A menu-by-menu walkthrough: what each person opens, what they press, and what the system does — from the day goods arrive to the moment the barcode scans at the counter.

Who this is for: the warehouse team at Ranchi, the office at Patna, and the store staff. Every menu name below is exactly what is written on the screen. Nothing here needs any technical knowledge.

1. The journey in one line

Goods arrive → receipt made at **Receive Goods** → PT file mapped or made at **PT Files** → checked and **Sent to Patna** → Patna presses **Push into system** → stock is official → sent to the store under **Transfer** (only if it landed at the warehouse) → counter syncs under **Till & Sync** → barcode scans at **Billing**.

The same journey as a table

Step	Who does it	Menu they open	What it achieves
1	Store or warehouse staff	Receive Goods → Receive	Records that the delivery arrived, with its invoice
2	Warehouse (Ranchi)	Receive Goods → PT Files	Turns the brand's file into the KDPS format, or makes a PT file for non-branded goods
3	Warehouse (Ranchi)	The PT file's own page	Fills the blanks, then sends the file to Patna
4	Patna office	The same PT file page	Pushes it into the system — this is when stock becomes real
5	Operations	Transfer	Sends the goods from the warehouse to the selling store
6	Store counter	Sell → Till & Sync, then Sell → Billing	Brings the new items onto the counter and sells them

2. Step 1 — Record the delivery

Menu: **Receive Goods** → **Receive**

What to do

1. Open **Receive Goods** → **Receive**.

2. Press **New receipt**. The button is drawn only for the people who receive — the store and the warehouse. The office opens the same list to watch what has arrived, without the button.
3. Choose the store or warehouse where the goods actually landed.
4. Type the **invoice number** and attach the invoice copy.
5. Enter what physically arrived, line by line.
6. Save. The system gives the receipt its own number (the GRN number).

Two kinds of delivery — this choice decides everything after

Kind	What it means	Where the goods land	Who supplies the PT file
Branded	Invoice + barcodes on the pieces + a file from the brand	Usually at a store	The brand sends it; the warehouse maps it
Non-branded	Invoice only, no barcodes, no brand file	At the warehouse	We make it ourselves in the system

Important: the invoice number is not optional paperwork. In the next step the system asks you to pick this receipt by its invoice number, so the goods and their pricing stay tied to the same arrival.

3. Step 2 — Make the PT file

Menu: **Receive Goods** → **PT Files**

The warehouse works this screen and the office reads it. A store person can open it too, but only to look: every button that changes a PT file is refused for them, so the work stays at Ranchi whichever way the screen is reached.

The page has two tabs. Use the one that matches the delivery.

Tab A — **PT File Mapper** (branded goods)

1. **Step 1 on screen:** pick the received invoice from the drop-down. Only arrivals that carry an invoice and have no PT file yet are listed.
2. Press **Map this invoice**.
3. **Step 2 on screen:** drop the brand's file into the box. Excel and CSV files are accepted.
4. If the brand's file does not name the brand or the invoice date, fill those two boxes before dropping the file.
5. The system converts the brand's columns into the 22 KDPS columns and opens the file.

If there is genuinely no invoice, press **Map without an invoice**. Use this rarely — the link to the arrival is lost.

Tab B — **PT File Making** (non-branded goods)

- The top of the tab lists the arrivals that are still waiting for a PT file.

- Pick one and the system builds a PT file from that receipt, reading the invoice for you where it can.
- You then fill in the details the invoice never carried — size, colour tier, season — and price the rows.

Two helper screens on this page

Button	What it is for
Unmapped queue	Words from a brand's file the system has never seen — a colour name, a size code. Map each one once, and the system remembers it for every future file from every brand.
Learning proposals	Rules the system has worked out by itself from your past corrections, waiting for a yes or no.

4. Step 3 — Check the file and send it to Patna

Menu: **Receive Goods** → **PT Files** → press **Open** on the file

Every PT file page shows a three-step bar at the top, so you always know where it stands:

1 · Warehouse mapping Ranchi is still working on it	2 · Sent to Patna Waiting with the office	3 · Posted to system Done — stock is real
---	---	---

What to do on this page

1. Read the coloured note under the buttons. It tells you plainly whether the file is ready or something is missing.
2. Press **Only rows with blanks** to see just the rows that need attention.
3. Press **Edit table** to fill them. Empty cells are highlighted.
4. To fill a whole column at once, use the **Fill a whole column** bar — pick the column, pick the value, choose "only blank rows" or "all rows", press **Apply**.
5. When you correct a value, tick **remember** beside it. The system learns that correction and applies it to every future file.
6. Press **Save changes**.
7. Press **Send to Patna**.

Extra buttons on a non-branded (made) file

Button	What it does
P · Premium / M · Medium / E · Economy	Puts the price tier into the colour column on every row that has no colour
Free Size	Sets "Free Size" on every row with no size
Price blank rows	Works out the MRP on unpriced rows: purchase rate + 1.1% transport + the category margin, with GST added on top

A red note appears if any row is still missing a **barcode** or a **season**. The file cannot go to Patna until both are on every row.

Colour marks on the table

Mark	Meaning	What to do
Amber cell	The system worked this value out by judgement	Glance at it and move on if it looks right
Blue cell	A person typed this by hand	Nothing — it is a human decision and is kept
Empty cell with a dash	Nothing is there yet	Fill it before sending

5. Step 4 — Patna pushes it into the system

Menu: **Receive Goods** → **PT Files** → open the file marked *Sent to Patna*

What the office does

1. Open the file and look through the table.
2. If it is wrong, press **Send back** — it returns to Ranchi for correction.
3. If it is right, pick the booking from **Reconcile to booking** when there is one. This is optional.
4. Press **Push into system**.

What happens the moment that button is pressed

The system does this	Why it matters to you
Gives the file its own voucher number	The permanent reference for this inward, with no gaps in the numbering
Adds the quantity to stock at the receiving location	The goods now exist in the system's stock
Records every barcode as an item, with its brand, design, colour, size, HSN and MRP	This is what lets the counter recognise a scan later
Records the cost of each piece against its season	Profit can be worked out later without anyone typing it
Writes the accounting entry and the vendor's bill	The books and the stock always agree
Locks the file	A posted record is never edited. A mistake is fixed with Reverse posting , which is a fresh, visible correction

This is the single most important moment in the whole flow. Before this button, the goods are only paperwork. After it, they are stock the company owns and the counter can sell.

6. Step 5 — Send the goods to the store

Menu: **Transfer**

Skip this whole step when the goods were received at the selling store itself — they are already there. It applies when goods landed at the warehouse.

Menu line	Use it for
Transfer → Send Stock	Sending a set of pieces to one store
Transfer → Distribution	Splitting one arrival across many stores in a single grid, instead of raising the same transfer store by store
Transfer → Stock Request	A store asking the warehouse for stock
Transfer → In-Transit	Watching what has left but not yet arrived
Transfer → Transfers	The full list, and where the receiving store confirms what came in

The order of events

1. The warehouse raises the transfer and enters the bus number, courier number or vehicle number.
2. It is approved, then dispatched. The stock leaves the warehouse and shows under **In-Transit**.
3. A printed PT travels with the carton.
4. The store opens the transfer and records what actually arrived. Anything short or extra is recorded there and then.
5. The stock lands on that store's shelf in the system.

7. Step 6 — The counter

Menu: **Sell** → **Till & Sync**, then **Sell** → **Billing**

The billing counter works without internet. To do that, it keeps its own copy of everything it needs on the machine — item names, prices, tax rates, offers, salesmen, quantities. That copy is refreshed by syncing.

What to do

1. At store opening, open **Sell → Till & Sync** and press **Sync now**. This pulls a full fresh copy.
2. Through the day the counter tops itself up quietly in the background.
3. Open **Sell → Billing** and scan. The item name and price come up from the counter's own copy, so it works even if the line is down.
4. If a new arrival does not scan, go back to **Sell → Till & Sync** and press **Sync now** once.

What the counter is given, and what it is never given

Sent to the counter	Never sent to the counter
Barcode, brand, design, colour, size, HSN and the MRP on the tag	The cost price of any piece
Quantity of each barcode at this store only	Any other store's stock or prices
GST slabs, live offers, salesmen, the store's own settings	The company's margins or purchase rates

A store person can see the selling price of everything and the cost of nothing. This is built into the system, not left to trust.

8. Why a barcode does not scan

A new barcode reaches the counter only when all three of these are true. Check them in this order.

#	Condition	Where to check it
1	The PT file has been pushed into the system by Patna	Receive Goods → PT Files — the file must read "Posted to system"
2	The stock is at this store — received here, or transferred in and confirmed	Stock → Stock on Hand, or Transfer → In-Transit if it is still on the way
3	The counter has synced since then	Sell → Till & Sync, then press Sync now

If all three are true and the piece still does not scan, the barcode column on the PT file was most likely left blank or entered wrongly. Patna can reverse the posting and the warehouse can correct it.

9. Quick reference — who opens what

Menu → line	Used by	For
Receive Goods → Receive	Store, warehouse	Recording an arrival with its invoice
Receive Goods → PT Files	Warehouse and Patna office work it; store can look	Mapping or making the PT file, and posting it
Transfer → Send Stock / Distribution	Warehouse, operations	Moving stock out to stores
Transfer → In-Transit	Warehouse, store	What has left but not yet arrived
Stock → Stock on Hand	Store, warehouse, office	What is on the shelf right now
Stock → Search Across Stores	Store	"Who else has this in size L?"
Stock → Movement History	Office	Every movement of a piece, in and out
Sell → Billing	Counter	Selling
Sell → Till & Sync	Counter	Refreshing the counter's copy; checking what is still to reach head office
Offers & Price → Price Book	Office, store	The current price of every item
Offers & Price → Promotions	Office	Offers and the end-of-season markdown
Home → Approvals	Whoever approves	The one inbox for everything waiting on a yes or no

Looking and doing are different rights

Seeing a screen and being allowed to change what is on it are two separate permissions. Most screens open widely so people can check on their own work; the buttons that *move stock or money* are held much tighter. This is why two people can be looking at the same page and see a different set of buttons.

On this screen	Who may look	Who may press the buttons
Receive Goods → Receive	Store, warehouse, office	Store and warehouse — the people who take the delivery
Receive Goods → PT Files, and any PT file	Store, warehouse, office	Warehouse only — edit the table, re-map, Send to Patna
A PT file marked <i>Sent to Patna</i>	Store, warehouse, office	Patna only — Push into system . Send back is open to anyone who can open the file: it only returns the file to Ranchi and changes nothing else

Why it is built this way. Hiding a menu is not a lock — anyone who knows the address could still walk in. So the rule is checked where the work actually happens: on the button. A store person may open a PT file and read it, which is often exactly what they need in order to answer "has my delivery been priced yet?" — and every button that would change what the file says is refused for them. The office is the mirror image: it may open and read the whole receiving flow, and it presses the one button that is the office's alone — the posting that turns paperwork into stock.

Menu names are the same for everyone. What differs is how many of them a person sees, and how many buttons they get once inside — both follow the rights on their login. Nobody is offered a button the system will then refuse, and nobody is hidden from a screen they are allowed to read.
