

POS Requirements

1. Data we need to read from the POS

- **Sales (line items)** — bill date, bill no, store, salesman, customer, phone, barcode, item, brand, colour, size, design no, sub-category, gender, fit, season, qty, rate, gross, disc%, disc amt, net, bill amount, cash/card/credit
- **Stock-on-hand per store** — store, barcode, qty, as-of date/time
- **Daily collection per store** — store, date, cash, card, UPI, credit, total
- **Returns & exchanges** — bill no, original bill no, barcode, qty, amount, type, reason
- **Item master** — barcode, item, brand, colour, size, MRP, HSN, category, season
- **Historical export** (one-time) — past sales & stock per store/barcode

2. Data the POS must accept from us

- **Item / price master**
- **Per-store allocation (pending-inward)** — barcode, store, qty
- **Stock hold / reservation** — barcode, store, qty
- **Stock transfer** — from-store, to-store, barcode, qty, ref
- **Offers / EOSS** (later)
- **Barcode** — return the generated code to us, or accept ours

3. Access & technical

- API documentation
- Access credentials + test/sandbox environment
- Method: REST API / webhook / scheduled export
- Authentication + rate limits
- Format: JSON or CSV/Excel
- Frequency per feed (real-time / every few minutes / end-of-day)
- Stable record IDs (so a re-pull does not double-count)
- Barcode as the shared key, both directions

4. Please confirm

- ★ Can the POS export line-item sales automatically (API / scheduled file)?
- ★ Can the API accept a pending-inward / incoming-transfer quantity?
- Can it accept a hold / reservation (reduce sellable without removing stock)?
- How does it record an exchange — single "exchange", or return + new sale? Linked to the original bill?
- Can it return a generated barcode to us, or accept barcodes we send?

- What is available today, and the timeline for the rest?
