

Vendor Management Module

Record of vendors and their brands, and the bookings placed against them — from order to delivery, verification and return.

Scope — Version 1: Branded vendors only. Non-branded vendors and the agent record are planned for Version 2.

1. Records

- **Vendor** — the company KDPS buys from (the legal entity): contact, statutory and bank identity. One vendor can carry many brands.
- **Brand** — a label under a vendor. The commercial model and return terms are held per brand.
- **Booking** — an order placed with one vendor, for one brand, for one season.

2. Vendor record

Branded vendor

- Direct contact. No agent.
- Carries one of the four commercial models per brand.
- Two margins: normal-sale and discount-sale.
- Return window applies (Correction, SOR, Consignment).
- Payment-terms field on the record.

Statutory & bank identity

- **GSTIN** — more than one allowed (one per billing state).
- **State and PAN** — read from the GSTIN, not entered separately.
- **Registered address.**
- **Bank details** — account name, account number, IFSC.
- A vendor can be saved with these incomplete; payment requires GSTIN and bank details on file.

3. Commercial models

Set per brand and carried (snapshotted) onto each booking.

Model	Ownership	Returns
Buy & Sell (BNS)	KDPS owns outright. Sub-types: with vendor barcode (MRP capped) or without barcode (KDPS sets MRP).	None.
Correction (25-18-10)	KDPS owns. Margin 25% full-price, 18% during EOSS/discount. 10% goods-return allowance on delivered goods, stretchable per brand to 12–15%.	KDPS applies manually, within the window and within the allowance.
SOR (Sale or Return)	Brand owns. KDPS sells and takes commission.	All unsold returns, no cap. Reorder via a fresh booking.
Consignment	Brand owns. Rolling top-up — KDPS can pull more without a fresh booking each time.	Vendor takes back unsold stock themselves. No cap.

4. Booking — structure

- Belongs to one vendor + one brand + one season. One vendor can have many bookings — one per brand per season.
- Lines: per style-code, per size, quantity. (No colour at booking.)
- Quantity-only, plus one optional estimated order value. Pricing/MRP set later at inward.
- Commercial model and a snapshot of its terms (margins, return window, allowance %) carried on the booking.
- Auto-generated booking number (e.g. BK-SS26-0012), plus an optional field for the vendor's own order reference.
- Season chosen from the system season list (not free text).

5. How a booking is created

Create flow

- Pick the season. If the next season does not exist yet, click **Generate Season** to create it from the pattern. A season can be deleted only while empty.
- Pick the vendor, then the brand — or upload the document and let the system read the vendor and brand from it.
- Upload the receiving document → review the draft → confirm. The booking then becomes **Booked**.

Branded — upload-driven

- Order placed by in-person visit; vendor gives a printed receiving document.
- The system reads style / size / quantity and drafts the booking.
- A clear printed document is mostly auto-filled; a clearer photo is requested only when too much is unreadable.

- The system never creates the booking on its own — the handler reviews and confirms.

6. Receiving & verification

- The booking's order list pre-fills the GRN. On arrival, the receiver enters what physically came in and notes anything short or damaged, then generates the GRN.
- One booking can have many GRNs — stock can arrive over several shipments.
- Over-receipt is allowed: unbooked items/sizes can be received on the same screen, flagged as a variance with a required remark.
- Damaged on arrival: the piece enters stock as quarantined (not sellable) and routes to the defective-return flow.
- Warehouse-delivered shipments are counted and GRN'd at the warehouse. Store-delivered shipments are received by the store operator against the order; the warehouse person finalises the GRN.
- The GRN object lives in the Inbound module. Booking provides the order list and receives the close-out.

7. Booking status

Receiving statuses are calculated from the booking's GRNs. Close and cancel are manual and require a remark. Nothing closes automatically.

Booked → Partially received → Fully received → Return window open (Correction / SOR / Consignment) → **Closed / Cancelled**

Status	Meaning
Booked	Order confirmed; nothing received yet.
Partially received	Some booked quantity received; the rest pending.
Fully received	Received quantity covers every line.
Return window open	Correction, SOR & Consignment only; booking stays open until the window passes or unsold stock goes back. Buy & Sell closes at fully-received.
Closed / Cancelled	Manual, with a remark.

8. Returns by model

Model	Return mechanism
Correction (25-18-10)	KDPS owns the goods; returns within a capped allowance, applied manually within the window. Allowance budgeted per brand per season. Window alerts at 30 / 15 / 7 days.
Buy & Sell (BNS)	Outright — no returns. Closes at fully-received.
SOR	Brand owns; all unsold returns, no cap. Reorder via a fresh booking. Window alerts at 30 / 15 / 7 days.
Consignment	Brand owns; vendor takes back unsold stock. Rolling top-up. No cap.

Correction return allowance (season GR budget)

- One allowance per brand per season. Applies to the Correction model only.
- Basis is set per brand: **% of delivered value** (e.g. 10% of ₹10,00,000 = ₹1,00,000) **or % of delivered quantity** (e.g. 10% of 2,000 pieces = 200 pieces). Default 10%, stretchable to 12–15%.
- The allowance builds up as goods are received and reduces as goods are returned.
- Returns beyond the allowance are still processed and flagged with the over-limit amount.
- Balance is calculated and shown on the vendor/brand page and on each Correction booking; window alerts include the balance.

9. Standing rules

- Every edit needs a remark — who and why. Full audit trail.
- Nothing auto-closes. Close and cancel are manual.
- Changes go through authorisation, not silent direct edits.
- A booking is tracked from creation — booked-vs-received accounted end to end.

10. Not in Version 1

- Non-branded vendors and the agent record (planned for Version 2).
- User roles / access / approval hierarchy.
- Hard pricing / MRP (set at inward).
- SKU / barcode creation (created at the Inbound stage).
- Colour at booking line level.
- Spending cap / order budget.
