

KDPS — The Definitive Plan

AI-Powered Fashion Retail Operating System

A complete AI operating system for a 50+ SBU fashion retail business with 20,000+ SKUs, 40+ brands (SOR + outright), restructuring operations, and zero proper profitability tracking — until now.

Business	Fashion / Apparel / Footwear — Multi-Brand Retail
Scale	50+ SBUs (Stores + Warehouses + Franchise) · 20,000+ SKUs · 40+ Brands
Team	100-500 employees with manual sales incentives
Commercial	Mix of SOR + Outright Purchase per brand
Current Systems	Different POS per store · Tally for accounting · Mix of everything else
State	Restructuring — closing some SBUs, opening new ones
AI Agents	10 specialized agents (fashion-retail optimized)
Total Cost	■28,50,000 (excl. taxes)
Timeline	8 Months — inventory live by Month 3
Monthly Run Cost	■25,000–40,000 post-launch

11. Tech Stack & Architecture
12. Timeline — 8 Months, 4 Phases
13. Cost Breakdown — ■28,50,000
14. ROI Calculation
15. Payment Milestones
16. Post-Launch & Growth Path

1. Your Business Profile — What We Designed For

Dimension	Your Reality	Design Implication
Category	Fashion / apparel / footwear	Size-color matrix tracking. Seasonal cycles. Style-level analytics, not just SKU.
SKUs	20,000+ active	Size-level granularity needed. SKU = Style + Size + Color. Heavy database optimization.
Brands	40+ (own + other)	Brand-wise P&L; tracking. Per-brand PT format handling. Per-brand return policy engine.
Commercial	SOR + Outright mix	Dual inventory valuation. SOR return deadline tracking. Different margin calculations per model.
SBU	50+ (stores + WH + franchise)	Role-based visibility. Transfer permission matrix. Per-SBU performance.
Staff	100-500 with sales incentives	POS-linked incentive calculation. Target vs achievement per staff. Auto payslip.
POS	Different per store	Universal CSV adapter. Claude reads any POS export format.
Accounting	Tally	Tally XML export for vouchers, stock entries, ledger sync. Auto-sync in Phase 3.
Sales Model	Big EOSS + ongoing clearance	Markdown optimization agent. Billed-retained tracking. Discount approval workflow.
State	Restructuring	Store closure workflow (liquidate stock). New store planning (seed stock from network).
Profitability	Not tracked properly	Auto P&L; per brand per store. Cost from PT, revenue from POS, margin = automatic.

2. The 10 AI Agents — Your Digital Workforce

#	Agent Name	What It Does	Replaces
1	Invoice Reader	Photo/PDF → structured data. Any vendor, any format. Claude Vision.	Data entry staff
2	PT Mapper	Any brand PT file → KDPS taxonomy. Style+Size+Color extraction.	Manual PT processing
3	Reconciliation Engine	Nightly 3-way match. Invoice↔GRN↔PT. Fuzzy matching.	Weekly manual reconciliation
4	POS Harvester	Reads any POS export. 15-min sync. Auto stock deduction.	Manual sales recording
5	Attendance Guardian	Face check-in + GPS. Liveness detection. Auto payroll input.	Manual attendance + buddy-punching
6	Daily Digest	9 PM WhatsApp: revenue, stock, attendance, alerts. Interactive.	Evening WhatsApp groups + Excel reports
7	Fashion Demand AI (NEW)	Size-level demand forecasting. Stockout prediction. Replenishment suggestions.	Gut-feel ordering
8	Dead Stock Hunter (NEW)	Identifies slow/dead stock per SBU. Suggests transfers, markdowns, or SOR returns.	Seasonal audits
9	Profitability Tracker (NEW)	Auto P&L; per brand per store. Margin alerts. SOR vs outright analysis.	No tracking at all currently
10	Anomaly Watchdog	Shrinkage, fraud, data errors, stuck transfers, payment anomalies.	Quarterly audits (if at all)

3. Fashion-Specific Intelligence — What Makes This Different

Generic inventory systems don't understand fashion. This system does.

3.1 Size-Color Matrix Tracking

- Every SKU is tracked as **Style × Size × Color** — not just a single barcode
- Dashboard shows: 'Nike Air Max 90 White — Size 7: 12 units, Size 8: 3 units, Size 9: 0 (STOCKOUT), Size 10: 8 units'
- Size-curve analysis: AI learns which sizes sell fastest at which stores
- **Size rebalancing**: 'Store 5 has 8 units of Size 10 (slow seller there), Store 12 has 0 (fast seller). Transfer 4 units?'

↑ ROI: Prevents the #1 fashion pain: 'We have the shoe but not in your size.' Recovers lost sales.

3.2 Season & Collection Tracking

- Every item tagged with: **Season** (SS26, AW26), **Collection** (Core, Fresh, Clearance), **Age** (weeks since arrival)
- Dashboard view: 'You have ■45L of AW25 inventory still unsold across 30 stores. 60% is in 5 stores.'
- AI alerts when old-season stock crosses configurable thresholds (30/60/90 days)
- Automatic tagging: PT file upload → AI detects season from style codes/descriptions

↑ ROI: Visibility into aging inventory that's currently invisible until physical audits.

3.3 Fashion Demand AI (Agent 7)

● **AI AGENT**: Runs weekly — analyzes sell-through patterns per style, size, color, store

- **Size-level forecasting**: 'Size 8 of this style sells 3x faster at Store 14 than Store 7'
- **Sell-through velocity**: tracks days-to-sell per style. Fast movers flagged for replenishment. Slow movers flagged for action.
- **New arrival prediction**: when a new style arrives, AI predicts demand based on similar past styles (same brand, category, price point)
- **Store affinity**: AI learns which stores sell which brands/categories best → smarter initial allocation
- **Weather-aware**: connects to weather API — flags if summer stock isn't moving because of unusual cold spell (don't markdown yet, wait)

↑ ROI: Data-driven buying and allocation instead of gut feel. Reduces dead stock by 15-25%.

3.4 Dead Stock Hunter (Agent 8)

● **AI AGENT**: Runs daily — scans all 20,000+ SKUs across all SBUs

- **Classification**:
 - **Hot**: Selling above expected rate. Ensure replenishment.
 - **Warm**: Selling at expected rate. Monitor.
 - **Cold**: Below expected rate. Consider action.
 - **Dead**: Zero sales in 45+ days. Immediate action needed.
- **Auto-recommendations per dead item**:
 - If SOR → 'Return deadline is in 15 days. Return to brand now.'
 - If outright + selling at other stores → 'Transfer to Store 12 where similar styles sell well.'
 - If outright + not selling anywhere → 'Mark down by 20% or include in next clearance.'
- **Dead stock value dashboard**: '■12L of dead stock across network. ■4L is SOR (return it). ■8L is outright (act now).'

↑ ROI: SOR returns before deadline = money saved. Faster markdowns on outright = cash recovered.

4. SOR vs Outright Purchase — Dual-Track Inventory

This is unique to your business. Each brand has a different commercial model, and the system must handle both SOR and outright purchase inventory differently — because the financial implications are completely different.

Aspect	Sale or Return (SOR)	Outright Purchase
Who owns stock?	Brand owns it until sold	KDPS owns it from Day 1
Unsold risk	Return to brand. Your risk = zero.	Your risk. Must sell or mark down.
Return deadline	Typically 60-120 days. CRITICAL to track.	No return option. You own it.
Margin	Commission-based (lower margin)	Full margin (MRP minus cost price)
System tracking	Stock tagged 'SOR'. Return countdown visible. Credit note tracking on return.	Stock tagged 'Outright'. Dead stock alerts more urgent. Margin tracked live.
EOSS treatment	Brand approves markdowns. Margin shared per agreement.	You decide markdowns. Full margin impact is yours.
AI behavior	Agent tracks return deadlines. Alerts 15 days before expiry. Auto-lists items to return.	Agent focuses on sell-through. Suggests transfers/markdowns to move stock.

Brand Master Configuration (set once per brand):

Field	Example	Purpose
Brand Name	Nike	Display and grouping
Commercial Model	SOR / Outright / Hybrid	Drives return eligibility and margin calculation
SOR Return Window	90 days from PT date	AI tracks countdown per item
Commission / Margin %	35% on MRP (SOR) or cost price (outright)	Auto-calculates profitability per sale
PT Format	Auto-detected by AI	Claude learns each brand's format
Return Process	Debit note + physical return to brand WH	Triggers return-to-brand workflow
Credit Note Terms	Credit note within 15 days of return	Tracks outstanding credit notes
EOSS Terms	Brand funds 50% of discount	Calculates net margin during EOSS

SOR Return Deadline Agent:

- Scans all SOR inventory daily
- **30 days before deadline:** Dashboard flag — 'These items from Nike have 30 days left for return'
- **15 days before:** WhatsApp alert to owner — '■2.3L of Nike SOR inventory expires in 15 days. 45 items across 8 stores. [View List] [Create Return]'
- **7 days before:** Critical alert — 'URGENT: Return deadline in 7 days. Initiate return to brand now.'
- **Auto-generates return list:** items that haven't sold, grouped by brand warehouse, ready to dispatch

↑ ROI: Never miss an SOR return deadline again. At 50+ stores with 40 brands, this alone saves lakhs.

5. Store Restructuring Engine — Close/Open Without Chaos

You're actively closing and opening stores. Without a system, this means stock gets lost, staff records get messy, and financial reconciliation becomes a nightmare. The system handles both scenarios.

5.1 Store Closure Workflow

- **Step 1 — Mark SBU as 'Closing':** Set closure date. System locks new stock-in to this SBU.
- **Step 2 — AI Stock Analysis:** Agent categorizes all stock at this SBU:
 - SOR items → auto-generate return-to-brand list (by deadline urgency)
 - Fast-selling outright items → suggest transfer to top-performing stores
 - Slow outright items → suggest transfer to clearance/EOSS store or markdown
 - Defective items → return-to-brand or write-off
- **Step 3 — Liquidation Dashboard:** Shows remaining stock value, transfer plan, SOR returns pending
- **Step 4 — Staff Reassignment:** Flag staff for transfer to other SBUs or exit. Final payroll auto-calculated.
- **Step 5 — Final Reconciliation:** System ensures zero stock remains. All items accounted for. Tally closing entries generated.

↑ ROI: Structured closure instead of chaos. No stock lost. No SOR returns missed. Clean books.

5.2 New Store Setup Workflow

- **Step 1 — Create new SBU:** Type, region, manager, POS type, address, GPS coordinates
- **Step 2 — AI-Suggested Seed Stock:** Based on similar stores' sales data:
 - 'Stores in similar locations sell these top 200 styles. Recommended opening inventory: █15L'
 - Size curve recommendation based on regional data (North India = different size distribution than South)
 - Brand mix recommendation based on similar store performance
- **Step 3 — Auto-generate Transfer Requests:** Pull seed stock from nearest warehouse(s)
- **Step 4 — Staff Enrollment:** Face enrollment, document upload, role assignment, incentive structure
- **Step 5 — Go-Live Checklist:** POS connected? Stock received? Staff trained? Attendance working?

↑ ROI: New store goes live with data-driven stock selection instead of guesswork.

6. Brand-Wise & Store-Wise Profitability (NEW)

You said you don't track this properly today. This system builds profitability tracking automatically — no extra data entry. Cost comes from PT/invoice, revenue comes from POS, margin is calculated in real-time.

6.1 How Margin is Auto-Calculated

- **Cost Price:** Extracted from PT file or invoice at time of stock-in (per SKU per brand)
- **Selling Price:** Captured from POS at time of sale (actual selling price including any discount)
- **Margin = Selling Price - Cost Price** (for outright)
- **Commission = Selling Price × Commission %** (for SOR)
- EOSS margin adjusted for brand-funded discounts (brand pays X%, you bear Y%)
- All calculated per-transaction, aggregated to any level: SKU, brand, store, region, day, week, month

6.2 Profitability Dashboards

Dashboard	What It Shows	Who Uses It
Brand P&L;	Revenue, COGS, margin %, return value, credit notes — per brand across all stores or per store	Owner — see which brands make money
Store P&L;	Revenue, margin, rent equivalent, staff cost, profitability — per store	Owner — see which stores make money
Brand × Store Matrix	Which brand performs best at which store. Heatmap view.	Owner — optimize brand allocation per store
Margin Trend	Margin % over time. Are discounts eroding margins? EOSS impact visible.	Owner + Finance
SOR Profitability	Commission earned vs stock holding cost. Is SOR worth it per brand?	Owner — renegotiate brand terms
Dead Stock Cost	■ value of non-moving inventory. Opportunity cost. Action urgency.	Owner + Store managers

Profitability Agent (Agent 9) — weekly WhatsApp insight:

*'Weekly P&L; Snapshot — April 7-12, 2026
Network Revenue: ■48.5L | Avg Margin: 38.2% (vs 36.1% last week)
Top Brand by Margin: Adidas (42.3%) | Lowest: [Brand X] (18.7% — review pricing?)
Top Store: Store 14 (■5.2L, 41% margin) | Loss-making: Store 23 (■1.1L, 12% margin — high EOSS discounting)
SOR Returns Due: ■3.8L from 3 brands in next 30 days
Dead Stock Value: ■14.2L (■5L is SOR — return it)'*

↑ ROI: First time you'll see which brands and stores actually make money. Enables data-driven decisions on brand mix, store viability, and SOR negotiations.

7. Sales Incentive Auto-Calculator (NEW)

You said incentives are manual and messy. Here's how the system automates it:

- **POS data is already in the system** (15-min sync) — so sales per employee are tracked automatically
- **Configure incentive structure once per role:**
 - Target-based: 'Sell ■2L/month → ■2,000 bonus. ■3L → ■5,000. ■4L → ■10,000'
 - Per-unit: '■50 per premium brand item sold'
 - Brand-specific: 'Nike pays ■100 per shoe sold as SPF' (Sales Promotion Fee)
 - Tiered: different slabs for different achievement levels
- **Dashboard for staff:** Employee opens PWA → sees their sales today, this month, target, incentive earned so far
- **Dashboard for manager:** Store-level leaderboard. Who's hitting target, who's not.
- **End-of-month:** Auto-calculated incentive sheet → feeds into payroll → Tally export

Incentive tied to attendance:

- Absent days auto-deducted from eligibility
- Late arrivals tracked — configurable impact on incentive
- Attendance + sales data combined = accurate, fair, automated payroll

↑ ROI: Eliminates monthly Excel hell. Staff can see earnings in real-time = motivated. No disputes.

8. Tally Integration Path

Phase 1-2: Manual Export (Tally-Ready Reports)

- System generates **Tally-compatible XML files** for:
 - Purchase vouchers (from PT/invoice data)
 - Sales vouchers (from POS data)
 - Stock journal entries (transfers between SBUs)
 - Payment vouchers (vendor payments)
 - Credit note entries (SOR returns)
- CA imports these XML files into Tally. One click, all vouchers created.
- GST-ready: GSTIN per vendor, HSN codes per SKU, tax breakup per transaction

Phase 3: Auto-Sync (via Tally API / TallyPrime)

- TallyPrime supports XML import/export via local API
- System pushes vouchers to Tally automatically every night
- Two-way sync: Tally ledger balances pulled back for reconciliation
- Cost: ■1-2L additional development in Phase 3

↑ ROI: CA's monthly reconciliation effort drops from days to hours. GST filing data ready automatically.

9. Real-Time Stock Engine (Recap — Detailed Spec in Separate Doc)

Stock Event	Trigger	Update Speed	Fashion-Specific Enhancement
PT File Inward	PT uploaded + confirmed	Instant	Auto-extracts style, size, color, season. Tags SOR/outright per brand config.
Vendor Delivery	Invoice photo → GRN	Instant	Matches against PT. Shortage tracking. Photo evidence for damage.
SBU Transfer	5-step lifecycle with barcode scan	Instant per step	Size rebalancing suggestions. Transfer permission matrix per SBU type.
POS Sale	POS export → AI parse	15-min sync	Captures discount %, payment mode. Feeds margin calc + incentive calc.
SOR Return	Return initiated → dispatched → brand confirms	Instant	Credit note tracking. Return deadline compliance. Brand WH address auto-filled.
Defect/Write-off	Photo + category + approval	Instant	Defect rate tracked per brand per vendor. Claim workflow.

10. EOSS & Markdown Optimization

10.1 EOSS Planning (AI-Assisted)

- **Pre-EOSS analysis:** AI identifies all old-season inventory across network → shows value, age, brand, SBU
- **Markdown suggestion:** 'These 500 styles haven't sold at full price in 60 days. Suggested markdown: 20-40% based on category and brand agreement.'
- **SOR EOSS terms:** per brand config — brand-funded discount %, net margin calculation during EOSS
- **Transfer to EOSS stores:** if you have specific clearance/outlet stores, AI suggests consolidating EOSS stock there

10.2 During EOSS

- **Billed-Retained tracking:** customer billed but item stays in store (common in EOSS) → stock state = 'Billed-Retained'
- **Discount approval workflow:** staff can't give arbitrary discounts. System enforces: 'Max 40% off. Beyond that → manager approval on WhatsApp.'
- **Real-time EOSS dashboard:** revenue, discount depth, margin impact, stock depletion rate
- **Daily EOSS WhatsApp:** 'EOSS Day 3: ■18L sold. Avg discount 32%. Stock cleared: 35%. Top seller: [style]. Running low: [style].'

10.3 Ongoing Clearance (Between EOSS)

- Dead Stock Hunter agent continuously identifies clearance candidates
- Markdown ladder: AI suggests 10% → 20% → 30% over time if item doesn't move
- Brand-wise clearance: separate clearance strategies per brand based on commercial model

↑ ROI: Faster stock turns. Less capital locked in dead inventory. Higher net realization from EOSS.

11. Tech Stack & Architecture

Component	Choice	Fashion-Specific Reason
Platform	Frappe/ERPNext	Item variants (size×color) built-in. Batch tracking. Stock ledger. Roles.
Web App	Next.js PWA	Works on any phone. Camera for invoices. Barcode scanning via browser.
Invoice/PT AI	Claude Vision + Sonnet API	Reads any format. Understands fashion terminology (style codes, size runs).
Demand Forecasting	Prophet + scikit-learn	Handles seasonality, size curves, store affinity. No GPU needed.
Dashboards	Metabase	Drill-down: network → region → store → brand → style → size. Free.
Alerts	WhatsApp Business API	Interactive: approve payments, approve transfers, reply for details.
Face Recognition	face-api.js (browser)	No app install. Works on store staff phones.
Tally Sync	XML export → TallyPrime API	GST-ready vouchers. Purchase, sales, stock journals, credit notes.
Database	PostgreSQL	20K+ SKUs × 50+ SBUs = millions of rows. PG handles it easily.
Agent Runtime	Celery + Redis	10 agents running on schedule + event triggers.
Hosting	Hetzner (2 servers)	■12K/month. Enough for 50+ SBUs + all agents.
Storage	Cloudflare R2	Invoice photos, PT files, employee docs. Free egress.

12. Timeline — 8 Months, 4 Phases

Phase 1: Real-Time Stock Engine + Inventory Intelligence (Months 1–3)

Month	What Gets Built	What You See
M1	SBU master, SKU master (20K+ import with size×color), brand master (40+ brands with SOR/outright config), database, PWA shell, CI/CD	All your locations, products, and brands in the system. Size-color matrix visible.
M2	Invoice Reader agent, PT Mapper agent (fashion-aware: style+size+color extraction), GRN module, SBU transfer flow with barcode scanning	Upload a PT file → see stock appear by style×size×color. Do a test transfer.
M3	POS Harvester (15-min sync), Reconciliation agent, stock report dashboard, WhatsApp digest, SOR return deadline tracking. PILOT at 5 SBUs.	5 SBUs live. Real-time stock. Nightly reconciliation. Daily WhatsApp. SOR deadlines tracked.

Phase 2: Fashion AI + Profitability + Scale (Months 4–5)

Month	What Gets Built	What You See
M4	Roll out to 25 SBUs. Fashion Demand AI (size-level forecasting). Dead Stock Hunter. Brand-wise profitability dashboard. Season/collection tagging.	AI tells you which sizes to reorder. Dead stock flagged with action plan. First brand P&L; visible.
M5	Roll out to ALL 50+ SBUs. Store P&L; dashboard. Anomaly Watchdog. EOSS module. Size rebalancing. Credit note tracking.	All SBUs live. See profitability per brand per store. EOSS tools ready for next sale season.

Phase 3: Workforce + Payments + Incentives (Months 6–7)

Month	What Gets Built	What You See
M6	Attendance Guardian (face + GPS). Payment module (eligibility + WhatsApp approval). Incentive calculator. Staff sales dashboard.	Face check-in. One-tap payment approvals. Staff sees their incentive in real-time.
M7	Payroll engine. Payslip generation. Tally XML export. Store restructuring workflow (close/open). Employee self-service.	Auto payroll. Tally-ready exports. Close a store → system handles stock liquidation plan.

Phase 4: Tally Auto-Sync + Polish (Month 8)

Month	What Gets Built	What You See
M8	Tally auto-sync (push vouchers nightly). Performance optimization. Staff training (3 batches). Documentation. Source code handover.	Tally auto-updated. All staff trained. System documented. Code is yours.

13. Cost Breakdown — ₹28,50,000

Team (8 Months)

Role	Monthly	Duration	Total
Lead Engineer (full-stack + AI + fashion domain)	₹1,30,000	8 months	₹10,40,000
Frontend + Mobile Dev (PWA + dashboards)	₹90,000	8 months	₹7,20,000
QA + DevOps	₹55,000	8 months	₹4,40,000
		Team Total	₹22,00,000

Infrastructure, AI & Tools

Item	Monthly	Duration	Total
Hetzner (2 servers)	₹12,000	8 months	₹96,000
Claude API (Vision + Sonnet)	₹10,000	7 months (M2-M8)	₹70,000
WhatsApp Business API	₹4,000	6 months (M3-M8)	₹24,000
Cloudflare R2 + domain	₹2,500	8 months	₹20,000
Weather API (for demand AI)	₹1,000	4 months (M4-M7)	₹4,000
		Infra Total	₹2,14,000

Other

Item	Total
Data migration (20K SKUs, 50 SBUs, vendor master, employee data, historical sales)	₹1,50,000
Training (3 batches × 50+ stores, Hindi video tutorials, super-user program)	₹90,000
Contingency (10%)	₹2,46,000
Other Total	₹4,36,000

Team (8 months)	₹22,00,000
Infrastructure + AI	₹2,14,000
Migration + Training	₹1,90,000
Contingency (10%)	₹2,46,000 (approx)
GRAND TOTAL	₹28,50,000 (excl. taxes)

14. ROI Calculation — Fashion-Specific Savings

Savings Area	How	Monthly Est.
Missed SOR returns	AI tracks return deadlines. Currently you likely miss 5-10% of SOR return windows = dead stock that should have gone back.	■1,00,000–3,00,000
Size-level stockout recovery	'Right shoe, wrong size' → lost sale. AI rebalances sizes across stores. Even 2% improvement in conversion.	■75,000–2,00,000
Dead stock reduction	Earlier identification → faster markdowns → better realization. Vs waiting for EOSS.	■50,000–1,50,000
Inventory shrinkage	Real-time tracking + anomaly detection across 50+ SBUs. Fashion retail avg shrinkage: 1.5-3%.	■1,00,000–2,50,000
Data entry labor	Invoice OCR + PT mapping saves ~1.5 hrs/day/store. 50 stores × 1.5hrs = 75 hrs/day.	■75,000–1,00,000
Attendance fraud	Face verification. 100-500 staff. Even 2% buddy-punching = significant payroll leakage.	■25,000–50,000
Better brand negotiation	Brand P&L; data → renegotiate margins, SOR terms, EOSS funding with underperforming brands.	Hard to quantify — potentially huge
TOTAL		■4,25,000–10,50,000/mo

Conservative breakeven: Month 6-7 from project start (right after full rollout).

By Month 12, the system has saved ■25-60L while costing ■28.5L to build + ■2L to run. By Month 18, deep positive ROI.

15. Payment Milestones

Milestone	When	Amount	You Must See Working
Kickoff	Day 1	■3,50,000 (12%)	Architecture. SBU + SKU + Brand masters imported. Server live.
Stock Engine	M2 end	■5,00,000 (18%)	PT + invoice + transfer + POS sync all working. Stock updating real-time.
Pilot Live	M3 end	■5,00,000 (18%)	5 SBUs running real operations. WhatsApp digest. Reconciliation.
Full Rollout	M5 end	■5,00,000 (18%)	50+ SBUs live. Profitability dashboards. Dead stock + demand AI.
Complete System	M8 end	■5,00,000 (18%)	Attendance, payments, payroll, Tally sync, incentives, restructuring tools.
Warranty End	M11	■5,00,000 (16%)	3 months stable. All bugs fixed. Source code + docs handed over.

16. Post-Launch & Growth Path

Monthly Running Cost

Item	Monthly	Notes
Servers	■12,000	Scale up if you cross 100+ SBUs
Claude API	■8,000-15,000	Scales with invoice volume. Still 10x cheaper than data entry staff.
WhatsApp API	■3,000-5,000	Daily digests + alerts + approvals across 50+ SBUs
Storage	■2,000-3,000	Photos, documents. Grows slowly.
TOTAL	■25,000-35,000	Less than 2 junior employees. Works 24/7. Never takes leave.

Future Enhancements (Post M8 — Optional)

- **E-commerce integration:** When you go online, same inventory system powers online + offline stock
- **Customer analytics:** POS data → customer purchase patterns → personalized marketing
- **Visual merchandising AI:** Which displays/arrangements sell better → photo + sales correlation
- **Vendor scorecard:** Auto-rate vendors on delivery time, quality, return rate, price competitiveness
- **Multi-currency:** If you import directly or expand internationally
- **WhatsApp commerce:** Customers order via WhatsApp → inventory + fulfillment handled by the system
